MASTER PROMPT: VERA COMPLETE UI/UX ENHANCEMENT — APPLICANT SIDE AND ADMIN SIDE

Act as a senior UI/UX designer, frontend engineer, and design systems specialist who creates premium, futuristic, AI-era enterprise applications.

I am developing **VERA (Virtual Employment and Recruitment Assistant)**, a resume-job matching and recruitment management system for Confiable Manpower Solutions Inc.

I want you to enhance the UI/UX design of **THE ENTIRE EXISTING VERA WEB APPLICATION**, including every existing page on both the Applicant side and the Admin/HR side.

The current application is functional, but its interface looks too conventional, flat, and similar to an ordinary web-based recruitment system. I want it to look exceptionally modern, sophisticated, futuristic, premium, and visually impressive—as if it belongs to the age of AI.

However, this is a visual enhancement project, NOT a system redevelopment.

NON-NEGOTIABLE RULE: DO NOT CHANGE THE SYSTEM'S FUNCTIONALITY OR SCOPE

Our thesis already includes an Entity Relationship Diagram (ERD), Data Flow Diagrams (DFD), and Use Case Diagrams. The implemented system must remain consistent with those documents.

You are authorized to change the visual presentation, not the underlying system behavior.

Strictly follow these requirements:

1. Do not add, remove, or modify database tables, entities, fields, relationships, or constraints.
2. Do not change backend logic, APIs, database queries, authentication, authorization, permissions, or routes.
3. Do not introduce new features, modules, workflows, business rules, or user roles.
4. Do not change existing resume-job matching algorithms, cosine similarity calculations, Sentence-BERT implementation, Weighted Sum Model, competency weights, thresholds, or recruitment decision rules.

5. Do not add new AI capabilities, AI-generated recommendations, analytics, metrics, or explanations that the existing system does not calculate or support.
6. Do not remove, rename, or repurpose existing navigation items, buttons, form fields, tables, actions, or status labels.
7. Do not replace existing working functionality with static mockups, dummy data, or nonfunctional buttons.
8. Do not change existing data structures, API contracts, form validation rules, or application workflows.
9. Do not redesign the ERD, DFD, or Use Case Diagrams or introduce changes that would require updating them.
10. Do not replace the existing technology stack or introduce unnecessary dependencies.

Preserve existing event handlers, state management, API calls, data bindings, routes, form submissions, and component behavior.

If a proposed visual enhancement requires changing the system's functionality or data model, DO NOT implement it. Find a visual-only alternative.

1. OVERALL DESIGN DIRECTION

Transform VERA into a **Futuristic AI Enterprise Recruitment Platform**.

The finished interface should feel:

- Premium and professional.
- Futuristic and technology-driven.
- Sophisticated and visually distinctive.
- Clean, organized, and easy to navigate.
- Appropriate for an actual recruitment agency.
- Clearly different from generic admin dashboards and ordinary recruitment portals.

The objective is not to make the interface excessively flashy. The objective is to achieve a premium AI-era aesthetic while maintaining usability.

Use visual inspiration from modern enterprise AI platforms, premium SaaS dashboards, advanced analytics interfaces, and intelligent recruitment applications.

Avoid generic Bootstrap-looking interfaces, excessive empty space, repetitive plain cards, unnecessary borders, oversized headings, and excessive neon effects.

CORE DESIGN PRIORITY: EMPHASIZE VERA'S AI-POWERED RESUME–JOB MATCHING

VERA's primary differentiator is its resume–job matching capability using Sentence-BERT, cosine similarity, and a Weighted Sum Model (WSM). The entire visual design should reinforce this identity while preserving all existing functionality.

The matching feature must receive the strongest visual emphasis wherever it is already displayed or used in the existing application, particularly on the Resume Screening page and related candidate evaluation screens.

Design requirements:

1. **Make existing matching results visually prominent.** Use polished score indicators, refined percentage badges, progress visualizations, and clear visual hierarchy to make existing matching scores easy to understand.
2. **Give Resume Screening a distinctive AI-era appearance.** This should be one of the most visually impressive pages in VERA, using sophisticated layouts, precise spacing, modern typography, and restrained electric-blue and cyan accents.
3. **Present existing matching information clearly.** Where supported by the current system, visually distinguish semantic similarity results, existing competency categories, configured weights, and the final weighted matching score. Only display values the application actually calculates or stores.
4. **Connect the visual identity across the application.** Use consistent AI-inspired styling across existing vacancy listings, applicant information, screening results, and recruitment reports wherever matching-related information is already available. Do not add matching scores to pages that do not currently support or display them.
5. **Preserve the actual algorithm and results.** Do not change Sentence-BERT, cosine similarity, the Weighted Sum Model, competency weights, thresholds, ranking rules, or recruitment decisions. Do not fabricate match percentages, skill explanations, recommendations, or other AI-generated information.
6. **Prioritize explainability only to the extent currently supported.** Improve the presentation of existing matching information without introducing new calculations, data fields, backend functionality, or workflows.

The desired outcome is for users and thesis evaluators to immediately recognize VERA's resume–job matching capability as its central technological feature, while the rest of the interface supports the complete recruitment process.

Design principle: Make the existing AI matching capability the visual centerpiece of VERA without changing how the system works.

2. ESTABLISH ONE CONSISTENT DESIGN SYSTEM

Create a unified visual design system and apply it consistently to EVERY existing page.

Color palette

- Midnight navy: #0D1B2A
- Deep navy blue: #123A63
- Electric blue: #155EEF
- Cyan accent: #22D3EE
- Confiable brand yellow: #FFCC00
- Main workspace background: #F3F8FF
- White: #FFFFFF
- Supporting text: appropriate slate and blue-gray tones.

Use midnight navy for navigation, electric blue for primary actions and active states, cyan for restrained highlights, and yellow to preserve Confiable's brand identity.

Use gradients and glow effects selectively. Keep text readable and maintain sufficient contrast.

Typography

Use a modern, professional typeface compatible with the existing project.

Establish a consistent hierarchy for:

- Page titles.
- Section headings.
- Card titles.
- Body text.
- Form labels.
- Supporting information.
- Table contents.
- Status indicators.

Components

Standardize the visual appearance of:

- Sidebars.
- Top navigation bars.
- Buttons.
- Cards.
- Tables.
- Forms and inputs.
- Dropdowns.
- Search fields.
- Tabs.
- Modals.
- Status badges.
- Notifications.
- Empty states.
- Loading indicators.
- Pagination.
- Charts.
- Tooltips.
- Confirmation dialogs.

Use consistent corner radii, spacing, icon sizes, shadows, borders, and interaction states.

Apply subtle transitions and hover effects without interfering with existing functionality.

3. APPLICANT SIDE — REDESIGN ALL EXISTING PAGES

Inspect the actual codebase and identify every existing Applicant-side page. The following are examples of pages visible in the current implementation; verify the actual routes and components before editing.

A. Login Page

Enhance the existing login screen with:

- A premium branded layout.
- A sophisticated Confiable-themed visual background.
- Better composition between the branding panel and login form.
- Modern input fields and buttons.
- Subtle blue gradients and refined lighting effects.

Preserve the existing login method, authentication behavior, links, validation, and account-access rules.

B. Set Up Your Profile / Resume Upload

Enhance the existing onboarding and resume-upload interface.

Improve the upload area, step indicators, typography, spacing, progress presentation, and visual feedback.

Preserve the existing file restrictions, resume-processing behavior, profile-review steps, and submission logic.

Do not introduce additional onboarding steps or new resume-processing functionality.

C. My Profile

Improve the presentation of the existing profile information, including personal information, contact details, address, education, and other fields currently supported.

Use clearly organized sections, consistent form styling, and a more polished layout.

Preserve all existing fields, editing behavior, validation, profile information, and application-related information.

D. Job Vacancies

Redesign the existing job vacancy listings while preserving the current vacancy information and application behavior.

Improve:

- Job card composition.
- Job title hierarchy.
- Company and location presentation.
- Employment-type indicators.
- Search field styling.
- Existing application status messages.
- Existing action buttons.
- Spacing and responsive behavior.

Do not invent salary information, AI match scores, job recommendations, or other fields that are not already supported by the system.

E. My Documents

Enhance the existing Resume, Supporting Documents, and Requests sections.

Improve the document table, upload interface, document-type selection, status badges, file information, empty states, and upload modals.

Preserve the existing document categories, file restrictions, verification statuses, replacement behavior, and upload logic.

F. Applicant Notifications and Application Information

Where existing notifications, application statuses, interview information, or application summaries appear, improve their visual presentation.

Use polished status indicators, readable timelines where an existing timeline is already supported, and consistent notification styling.

Do not introduce new notification types, workflows, or application statuses.

4. ADMIN / HR SIDE — REDESIGN ALL EXISTING PAGES

Apply the same visual identity to the Admin/HR interface while retaining the existing administrative workflows.

A. Admin Dashboard

Improve the presentation of the existing recruitment metrics and upcoming-interviews section.

Use premium KPI cards, consistent icons, clear numerical hierarchy, subtle accent colors, and refined empty states.

Keep the existing metrics and their meanings. Do not add reports, charts, metrics, or dashboard widgets that require new functionality.

B. Company List / Company Management

Enhance the existing company table, search field, Add company button, View and Edit actions, and company information modal.

Preserve all current company fields, records, sorting, search behavior, and CRUD operations.

C. Job Vacancies / Vacancy Management

Redesign the existing vacancy listing cards, status indicators, vacancy counts, and available actions.

Preserve all current vacancy records, filters, statuses, and navigation behavior.

D. Create and Edit Job Vacancy

This is a long, form-heavy interface. Improve its visual organization without changing the underlying form.

Enhance the existing sections, including:

- Company and position.
- Job description.
- Key responsibilities.
- Requirements.
- Prescreen qualifications.
- Selection settings.
- Competency weights.
- Existing publication and draft actions.

Use clear section headings, consistent input styling, logical spacing, readable labels, and better validation presentation.

Preserve every existing field, validation rule, weight calculation, threshold, and submission behavior.

Do not introduce a new multi-step workflow unless the current implementation already uses one.

E. Applicant Management

Improve the existing applicant table, search, filters, application information, statuses, and pagination.

Make candidate information easier to scan while preserving every existing column, record, filter, action, and application status.

F. Resume Screening

This is one of the most important pages in VERA because the system uses Sentence-BERT, cosine similarity, and a Weighted Sum Model for resume-job matching.

Make the existing screening interface visually distinctive through:

- Better candidate-card or table styling, according to the existing layout.
- Clear presentation of existing matching scores.
- Polished score badges and progress visualizations where appropriate.
- Better presentation of existing competency categories and weights.
- Clear distinctions between existing screening statuses.

- Improved spacing, typography, and action-button styling.

Use only the actual matching results and information already produced by the application.

Do not modify the algorithms, score calculations, ranking, thresholds, selection rules, or screening workflow.

Do not invent explainable-AI features, missing-skill analyses, or additional candidate metrics.

G. Interview Assessment

Enhance the existing interview-assessment interface, vacancy selector, scheduled-interview information, assessment forms, and empty states.

Preserve the current assessment process, fields, results, and navigation.

H. Endorsement Management

Improve the existing endorsement overview, vacancy cards, candidate lists, outcomes, score badges, and endorsement actions.

Preserve the existing endorsement workflow, client outcomes, status transitions, slot counts, rematching behavior, and available actions.

Do not introduce new approval stages or recruitment decisions.

I. Applicant Pool

Enhance the existing Waiting and Returned by Client tabs, applicant table, reason information, source vacancy information, and offer or invitation information.

Preserve all existing categories, filters, data, and applicant-pool behavior.

J. User Management

Improve the existing HR account table, account-creation modal, Edit actions, account status indicators, and Deactivate actions.

Preserve all existing user roles, account fields, authentication rules, permissions, and account-management behavior.

K. Recruitment Reports

Enhance the existing KPI cards, Applicant Progress chart, Hiring Outcomes chart, and Export PDF and Export Excel buttons.

Improve chart typography, spacing, legends, colors, responsiveness, and overall visual hierarchy.

Use only existing report data. Preserve export behavior and the meaning of all metrics.

Also fix any existing visual overflow without changing the underlying report calculations.

5. SIDEBAR AND TOP BAR CONSISTENCY

Create a unified sidebar and top-bar design across all applicable pages.

The sidebar should feature:

- Deep navy styling.
- Clear Confiable and VERA branding.
- Consistent modern icons.
- Improved spacing and typography.
- A polished electric-blue active navigation state.
- Subtle hover transitions.
- A clearly visible logout action.

Preserve each user's existing navigation items and access permissions. Do not show an Admin-only page to an Applicant or otherwise change role-based access.

The top bar should retain its existing page label, notifications, account identity, role information, and profile menu.

Do not introduce new navigation destinations or user actions.

6. FORMS, TABLES, MODALS, AND EMPTY STATES

Apply a consistent premium style across every existing form, table, modal, and empty state.

Forms should have clear labels, readable input text, polished focus states, consistent spacing, and visually distinct disabled states.

Tables should have clear headers, comfortable row spacing, readable content, subtle separators, and consistent action buttons.

Modals should have improved proportions, padding, shadows, typography, and button alignment while retaining their existing dimensions where functionally necessary and preserving all interactions.

Empty states should look intentional and helpful, with clean icons and concise explanatory text based on the actual state of the system.

Do not add new empty-state actions that require additional functionality.

7. RESPONSIVE DESIGN AND ACCESSIBILITY

Ensure all existing pages work correctly on:

- Desktop computers.
- Laptops.
- Tablets.
- Mobile devices.

Fix visual issues such as unwanted horizontal scrolling, clipped content, overflowing tables, misaligned controls, and inconsistent spacing.

Use responsive layouts that preserve all existing information and actions.

Maintain readable text contrast, visible keyboard-focus states, and appropriately sized interactive elements.

Do not compromise the usability of information-dense HR pages for the sake of visual effects.

8. IMPLEMENTATION WORKFLOW

Before editing anything:

1. Inspect the entire existing project structure.
2. Identify the frontend framework, routing system, styling approach, shared components, and existing icon libraries.
3. Enumerate all existing Applicant and Admin/HR routes and identify their corresponding components.
4. Inspect existing functionality before changing the presentation.
5. Identify opportunities to reuse shared styling and components without changing behavior.

Then implement the redesign directly in the existing project.

Use the current framework and dependencies wherever possible. Create or improve shared design tokens and reusable visual components when appropriate.

Keep changes scoped to the frontend presentation. Preserve all working logic and data connections.

Do not merely produce screenshots or a design proposal. Implement the visual improvements in the actual existing application.

Do not stop after redesigning the Dashboard or Company Management page. The objective is to enhance ALL existing Applicant and Admin/HR pages with one consistent design language.

Work systematically through the existing routes, and verify that each page retains its original functionality after styling changes.

If a page contains complex or sensitive logic, prioritize preserving that logic over making a visual change.

9. TESTING AND VERIFICATION

After implementation:

- Verify that every existing route still works.
- Verify that Applicant and Admin/HR navigation remains unchanged.
- Verify that search, filters, sorting, pagination, and buttons continue to work.
- Verify that existing forms, validation, file uploads, and modal interactions remain functional.
- Verify that matching results and calculations remain unchanged.
- Verify that account permissions and role restrictions remain unchanged.
- Verify that existing data is still retrieved and displayed correctly.
- Check for broken imports, build errors, missing icons, console errors, and responsive-layout problems.
- Verify that shared styling changes have not unintentionally broken other pages.

Do not claim that testing passed unless you actually perform the checks.

10. FINAL EXPECTED RESULT

The entire VERA application should look like a premium, futuristic, AI-era recruitment platform—not an ordinary web-based recruitment system.

The Applicant side and Admin/HR side must share the same visual identity while retaining their distinct existing interfaces, permissions, and workflows.

The design should feature midnight-navy navigation, electric-blue actions, restrained cyan highlights, Confiable yellow accents, refined typography, premium cards, modern tables, polished forms, and subtle visual effects.

Most importantly, the final implementation must preserve the system exactly as documented in our existing ERD, DFD, and Use Case Diagrams.

Final rule: REDESIGN THE ENTIRE EXISTING APPLICATION VISUALLY. DO NOT REDEVELOP, EXPAND, OR CHANGE THE SYSTEM.

When finished, provide:

1. A summary of all pages redesigned.
2. A list of files changed.
3. A confirmation of which existing functionalities were preserved.
4. Any issues that remain unresolved.
5. The results of the build and functional checks actually performed.
